# Principal Arterial Intersection Conversion Study

## **Background**

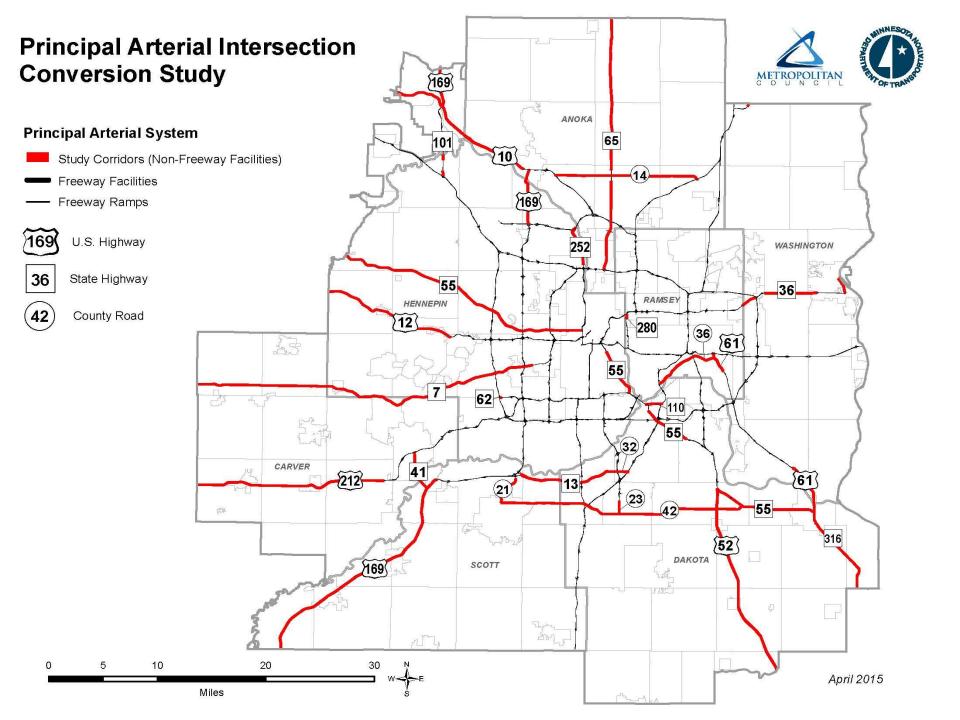

- Principal Arterials make up the National Highway System
  - PAs are 4% of the region's roadways, 50% of the VMT
  - Critical for mobility of passengers and freight
  - Freeways carry more traffic faster and safer than non-freeway facilities

### Why is the Study Needed?

- Grade-separation is a high priority for many agencies
- Difficult to identify what is a regional priority for these projects
- Identified as a Work Program Item in the 2040 TPP

#### Goals

- Analyze the benefits, costs, and impacts of converting key intersections to gradeseparated facilities
  - Focus on Non-Freeway Principal Arterials
- Prioritize locations and corridors on a regional level (high, medium, low vs. a ranking of #1 to #100)

### **Objectives**

- Form a common short and long-term vision
- Identify lower cost solutions (similar to what was completed for the Highway 10 Access Planning Study)
- Inform funding programs and the next TPP
  - Appendix F
- Help meet MAP-21 safety and mobility targets
- Provide direction for local planning efforts

#### Other

- Led by Met Council & MnDOT
- 18-month effort, study to be updated periodically
- Results included in the next TPP
  - Help identify Regional Mobility Improvements:
     Highway Strategic Capacity Enhancements

## **Next Steps**

- Finalize scope of work
- Select a consultant
- Begin work

#### Questions

Steve Peterson & Carl Ohrn
Metropolitan Council
651-602-1819 & 651-602-1719

Paul Czech
 MnDOT – Metro District
