Twin Cities
Highway Mobility Needs Analysis

Transportation Advisory Board
February 16, 2022

Consulting Team:
SRF Consulting Group
Sambatek, Inc.
Texas A&M Transportation Institute (TTI)
Associated Consulting Services (ACS)
Study Background

- MnDOT’s 20-year State Highway Investment Plan (MnSHIP) uses highway performance measures to distribute funding based on “need.”
- Current performance measures include bridge and pavement condition and safety; there is no measure for mobility, a largely metro area need.
- In MnSHIP, mobility funding is currently allocated at $50 M per year through 2026, after 2026 no mobility funding is allocated.
- MnSHIP will be updated throughout 2022 with adoption in spring of 2023.
Study Purpose

- **Purpose:** Define a mobility performance measure and quantify a range of metro area mobility funding needs based upon this measure to be used in the next MnSHIP update and future funding allocations.
- **Decisions on how to spend any newly allocated mobility funding will occur as part of the regional planning processes and reside with the Council, TAB, and MnDOT, based upon public and stakeholder input.
- **The range of potential mobility investments include:** travel demand management (TDM), traffic management and technology investments, low-cost geometric improvements, multimodal and transit advantages, intersection improvements, E-ZPass, safety projects, and auxiliary lanes.
Project overview

• For the first time in this region, the Metropolitan Council and the MnDOT developed a performance-based approach to highway mobility investment.

• The study focused on one of MnDOT’s 14 capital investment areas, Twin Cities highway mobility, to develop an investment needs number. Similar efforts have been completed for other areas like pavements & bridges.

• The needs number is not a plan for future spending. Needs numbers are compared across the 14 investment areas and then prioritized based on stakeholder input and available resources (total 20-year needs exceeded revenues by $18 billion in 2017).

• The outcomes of five different highway mobility investment levels were modeled.

• More study is needed to quantify the connection between mobility project types, locations, and greenhouse gas emissions - this work will start in 2022.

Delay is the extra time wasted by travelers due to congestion

Current annual delay per person is 42 hours

Delay/person is projected to increase by 33% to 56 hours by 2040 with no investment in this area
Performance target

A Twin Cities Highway Mobility target of 40-hours of annual delay per person was used to calculate MnDOT’s 20-year investment needs on the state highway system.

This study focused on capital highway investment.

Given the high cost of achieving the performance target by focusing only on capital highway investment, a range of solutions from travel demand management, transit/bicycle/pedestrian investment, land use changes, and other strategies will be needed to meet the target.

For instance, increased telework rates were shown to be effective in reducing delay.

The highway mobility need in the 2017 MnSHIP as $4.58 billion.
Connection to TAB

1. Regional Solicitation (Project Selection in late 2022):
   – Metro cities and counties have assisted in the planning and partial funding of highway mobility projects on MnDOT’s system.
   – 10 different cities and all 7 counties have been awarded funding for highway mobility projects on MnDOT’s system (primarily new interchanges) since 2014.
   – Typically, the Regional Solicitation funds part of the project cost with the local city/county and MnDOT paying the remainder.
   – The Regional Solicitation helps make these locally-led, multi-agency, partnership projects possible and will also contribute to meeting the performance target.
Connection to TAB Continued

2. Transportation Policy Plan (TPP) 2050 (Drafting Chapters in 2023)

Investment Priorities for Highway Mobility in 2040 TPP

1. Travel Demand Management (TDM)
2. Traffic Management Technologies
3. Spot Mobility (Lower Cost/High Benefit) (e.g., roundabouts or turn lanes)
4. MnPASS (E-ZPass)
5. Strategic Capacity Enhancements (e.g., new interchanges or lanes)

These investment principles were used throughout the project and contributed to the positive outcomes that were identified.
Planning Context

• Twin Cities highway mobility
  – Requires coordinated, collaborative planning at the local, state, and federal levels
  – Is not currently guided by a performance target
  – Helps to make strategic decisions based on data and to focus limited resources on the highest priorities
Delay per Capita

_Why measure highway mobility system performance in terms of delay per capita?_

- Simple
- Relatable at the regional, corridor, project and person-level
- Responsive to MnDOT/Met Council highway investment strategies
- Supportive of economic analyses
- Captures the extent to which highway mobility contributes to broader transportation goals

There are many measures of highway congestion that are important to consider in fully understanding the issue.
Modeled Results – Average Annual Delay

Delay per person per yearly workdays (in hours)

Year 2018: 42.0
2040 No Investment: 55.0
2040 Current Revenue: 50.7
2040 Increased Revenue: 45.9
2040 Beyond Increased Revenue 1: 43.3
2040 Beyond Increased Revenue 2: 39.5
Modeled Results – Job Access

Number of Jobs Accessible to the Average Twin Cities Resident by Auto in 30 minutes (7-8am)
Modeled Results – Vehicle Miles Traveled

Year 2018  2040 No Investment  2040 Current Revenue  2040 Increased Revenue  2040 Beyond Increased Revenue 1  2040 Beyond Increased Revenue 2
Vehicle Miles Traveled 2040 Modeling

- Follows methodology used in the 2040 Transportation Policy Plan (TPP).
- Population growth (+550,000 more people by 2040) is the primary driver of VMT.
- Accounts for some level of induced demand (increasing roadway capacity encourages people to drive more).
- Uses 2040 regional land use allocations by city as approved by the Met Council and shown in approved, local comprehensive plans. More study is planned to examine how land use changes may result from the increased mobility investment.
- Holds 2040 land use constant and does not change further based on investment.
- Modeling uses EPA’s MOVES model for assumptions for the rate of EV adoption and future fuel efficiency standards as it relates to emissions.
Freight Bottlenecks Improved

- 2040 Current Revenue: 39%
- 2040 Increased Revenue: 65%
- 2040 Beyond Increased Revenue 1: 90%
- 2040 Beyond Increased Revenue 2: 95%
Equity analysis

• How does job access of equity populations change under each funding scenario?
  o The number of additional jobs accessible due to the highway mobility investment was similar across income, race, and ethnic groups.

• What is the impact of each funding scenario on transit delay?
  o Transit delay decreased as highway mobility investment increased.
Telecommute Sensitivity Analysis

• Illustrative examples developed to understand outcomes at different levels of telecommuting

• Identify mobility needs with 15%, 25%, and 35% telecommuting
  – Pre-COVID, 5% of workers telecommuted at least one time per month
  – Peak of COVID, 35% of workers telecommuted at least one time per month
  – November 2021, 11% of workers telecommuted at least one time per month

• Increasing telework participation reduces the need for capital investment to meet the performance target
Twin Cities Highway Mobility Target
Performance Target

Use a Twin Cities Highway Mobility target of 40-hours of annual delay per person to calculate MnDOT's 20-year investment needs on the state highway system.

</table>

(Substantial decreases in greenhouse gas emissions through year 2040 are projected based on vehicle efficiency improvements; the overall magnitude of regional emissions in 2040 are not greatly influenced by these highway mobility investment scenarios, but further study is needed.)
Key Messages

– Delay/person is projected to increase by 33% by 2040 with no investment.
– Meeting the highway mobility target value (decrease of 5%) will:
  – Provide access to 180,000 more jobs within a 30-minute drive by 2040
  – $800 in travel time savings annually per household
  – 95% of the region's freight bottlenecks improved
  – Reduced transit delay for transit users
  – Limited impact on greenhouse gas emissions; further analysis is planned in this area in 2022
– This study focused on a capital highway investment approach. A range of solutions including travel demand management, transit, bike/ped, and land use will be needed to meet the target.
– The increase of telework that resulted during COVID-19 suggests that this is an effective strategy in reducing delay per person.
Next steps
Next Steps

– Electric Vehicle Planning Study (being finalized)

– Congestion Management Plan Handbook (ongoing)
  • Consider a range of lower cost alternatives to improve mobility

– Travel Demand Management Study (ongoing)

– Regional Transportation and Climate Change Measures (2022 start)
  • More study needed to understand and quantify the connection between transportation project types and greenhouse gas emissions

– Transportation Policy Plan Goals, including a review of the Regional Approach to Congestion (late 2022 start)

– MnDOT’s MnSHIP Update (2022/2023) with presentations to TAB planned
