

Kenilworth Corridor Area Design Principles

JUNE 13, 2015

The following DRAFT Design Principles have been developed with input from earlier community comments and project partners. These DRAFT principles will serve as a starting point for future refinement.

1. Establish a unified composition and an overarching design concept using consistent design vocabulary.
2. Preserve and build on the natural visual character for which the corridor is known today.
3. Consider the corridor user experience and neighbor's views of the corridor in all four seasons and during the day and night.
4. Use plantings and other materials to help minimize LRT infrastructure.
5. Subtly direct movement through the landscape and explore opportunities to create places to stop.
6. Use durable materials that are within the Project budget and are cost-effective to maintain.
7. Be climate appropriate and sustainable.
8. Allow for the safe interface between trail users, LRT infrastructure, and freight rail.
9. Let adjacent landscapes, landforms, public parks, and formalized connections influence and inspire designs.
10. Use design elements to highlight the public space in the corridor.
11. Consider the relationship between the station sites and the design of the station platforms/canopies and public art.
