

CHAPTER 3

LAND USE AND LOCAL PLANNING

Introduction

Transportation and land use play off each other. Transportation infrastructure gives value to land and influences its use. Land use, in turn, creates demand for transportation investment. Over time, this cycle has produced the development patterns we see in the region today. The transportation system provides access to land and development for people and freight. Land use and development patterns create the origins and destinations that directly affect the demand for travel and the relative attractiveness of different travel modes, whether auto, transit, bicycling, or walking. The demand for access and mobility will continue to grow and change, as will the region’s land use over the next 30 years. How we provide that access and mobility will strongly influence the development patterns we leave for future generations.

An Illustrated History of Transportation and Land Development in the Twin Cities

Since the early beginnings of the Twin Cities region, transportation technology has changed the way we get around. The way we get around has also changed how we have developed the region, including the location of housing, retail, industry, and employment. (Note: the following maps show the major highway system as a reference point, though these highways were primarily developed in the 20th century.)

1860 Population: 52,000

Early development in our region was marked by the establishment of Fort Snelling in 1825, and the four major activity centers along the Minnesota, Mississippi, and St. Croix rivers – the region’s first highways and power plants: Hastings, St. Anthony-Minneapolis, Saint Paul, and Stillwater.

Personal mobility was by walking, horse and buggy, ox cart, ferry, and train. Freight moved by river barge and train.

1900 Population: 492,000

In the late 1880s, the region's flour milling industries boomed and by 1900, Minneapolis and Saint Paul were dominant urban centers. Trolleys would eventually replace horse cars, and the popular line between the two major cities, which ran along University Avenue, carried more than 27 million rides in 1890. Annual streetcar ridership was 70 million by 1900, with a 100-square-mile network radiating from the central cities.

The Twin Cities region was also among the top 10 railroad centers with rail yards, warehousing, and manufacturing hubs radiating for 20 square miles outside the central cities.

Personal mobility was by walking, bicycle, horse and buggy, streetcar, ferry, and train. Freight moved by river barge and train.

1920 Population: 761,000

By 1914, streetcars provided most public transit in the U.S. But the 1920s era would bring technology advancements with the personal automobile and air travel. In our region, first-ring suburbs with industry would emerge, providing a greater need for community connections beyond the central cities. White Bear Lake and Lake Minnetonka established as resort and summer home destinations.

The airfield that would eventually become Minneapolis-Saint Paul International Airport was established in 1920. The region boasted 523 miles of streetcars, carrying 292 million riders per year.

Personal mobility expanded; methods included walking, bicycling, streetcars, trains, motorbuses, cars, airplanes. Freight was moved by river barge, train, and truck.

1940 Population: 987,000

By 1940, Minneapolis and Saint Paul have grown into a single urban center, and are beginning to be surrounded by suburban communities. Rural centers, including Anoka, Shakopee, and Stillwater are also beginning to grow.

As automobile use becomes the dominant form of personal transportation, walking, bicycling, and transit use decline. Public transit ridership had dropped to 128 million by 1940.

Personal mobility included walking, bicycling, streetcars, buses, trains, cars, airplanes. Freight moved by river barge, train, truck, and plane.

1960 Population: 1,590,000

Following World War II, the region's two-lane roads improve and expand. What began as two-lane roads extending about 10 miles from the urban center expanded, providing access to large tracts of undeveloped land. By 1960, the region had around 100 miles of freeway lane miles, leading to increased use of cars and continued decreased use of walking, bicycling, and transit. Transit ridership was 86 million annually in 1960.

Personal mobility included walking, bicycling, buses, trains, cars, airplanes. Freight moved by river barge, train, truck, and plane.

1980 Population: 1,985,000

By 1980, cars and trucks were the dominant form of transportation in the region. The energy crisis in the late 1970s triggered a brief spike in transit use; annual transit ridership was 93 million in 1980. The region's freeway system had grown to over 1,000 lane miles, and travel in the region increased significantly with more women in the workforce and jobs locating along highways outside the central cities.

A majority of the I-694 and I-494 freeway ring was completed by 1980 and growth quickly extended to and beyond this area.

Personal mobility included walking, bicycling, buses, trains, cars, airplanes. Freight moved by river barge, train, truck, and plane.

2000 Population: 2,642,000

In the latter part of the 20th century, roads and highways continued to expand and connections improved as the region continued to grow. But those roadways were also congested – congestion grew 500% between 1980 and 2000 on the region’s highway system. The freeway system had grown to 1,450 lane miles and transit ridership had dropped to 78 million.

Personal mobility included walking, bicycling, buses, trains, cars, airplanes. Freight moved by river barge, train, truck, and plane.

2010 Population: 2,850,000

By 2010, the region’s freeway system had grown to around 1,500 lane miles. Recent investments in the transit system helped ridership grow to 91 million annually. Highway investments moved away from new roads to improving the performance of the system and managing congestion.

The Great Recession nearly halted growth in the region, leading to a decrease in personal driving for the first time in decades. Walking, bicycling, and transit use all increased, particularly as a share of overall travel in the region.

Personal mobility included walking, bicycling, buses, light-rail and commuter trains, inter-city passenger trains, cars, airplanes. Freight moved by river barge, train, truck, and plane.

Before the 1950s, most of the region developed with streets and sidewalks centered on the streetcar. Beginning in the 1950s, the development of the region's highway system and later the freeway system greatly accelerated geographic access to open land available for new development. Once there is access, an area develops relative to the availability of land for future development, its sewer capacity, and consumer demand and preferences. Essentially, demand for particular types of locations drives development patterns.

The post-1950s development patterns in the region consisted of large areas that developed at single-family home densities (about 3 to 5 units per acre), shaped, in part, by regional roadways and local street networks. As the reach of the urban area expanded, highways and arterial roads were extended and widened to serve the growing demand.

With the high priority given to expanding roadway capacity to serve new development, the needs of pedestrians, bicycles, and transit users received less attention during and after the 1950s. Once established, residential land use patterns evolve slowly, particularly in areas that remain stable for generations. Consequently, changing existing land uses to increase density and intensity depends largely on adding connections among parts of the street and pathway networks and accommodating alternative modes of travel.

In contrast, job-related land uses change more frequently. Over the more than 20-year planning horizon of Thrive MSP 2040 and the 2040 Transportation Policy Plan, many job-related properties will change or be replaced due to structural, functional or economic obsolescence, opening opportunities for new mixed land uses and increased residential and job-related densities. These trends underscore the importance of local governments as they exercise their key role in making decisions about land use patterns and the local transportation network linking to the regional system.

Recent Trends in Transportation and Land Development

New residential construction in the Twin Cities region has ebbed and flowed with economic conditions since 1970. The growth of the region stalled temporarily during the Great Recession beginning in 2008 and the housing crash contributed to a significant downturn in new construction. However, recent estimates indicate that the region has begun growing its housing stock again. Since 2009, new permitted housing units each year have grown steadily, approaching the average annual rates seen before the recession. The mix of new construction has also evolved. More than half of new housing units have been attached or multifamily units. Activity by Thrive MSP 2040 Community Designation has shifted toward more Urban Center development, but there is a balance of new development across the region as well. Metropolitan Council estimates of 2016 population also provide evidence of this trend, with nearly half the growth in regional population from 2010-2016 occurring in Urban Center and Urban communities (see figure 3-1).

Figure 3-1 – Location of Housing Units Built 1970-2016, by Year & Thrive Community Designation

Consistent with the above trends, the region is "doing more with less" in that land consumption to accommodate new population and household growth has required less acreage compared with previous years. This trend has mitigated the trend of net losses of other land use types, like agricultural land. From 2010-2016, the region consumed about 234 acres per 1,000 new households. This consumption rate is dramatically less than previous decades where rates were more than 600 acres per new 1,000 households (see figure 3-2).

Figure 3-2 – Newly Development Land, Per New Resident and New Household

The recent trends in growth illustrate the balanced growth of the region across community types. So, while developed land continues to expand outward, the Twin Cities region is seeing more existing uses of land to accommodate population and household growth with a smaller footprint. Development is more likely to be on previously developed land than in previous decades. These trends also demonstrate the continued reversal of past out-migration from the developed area to the developing area to a more balanced trend of both newly developed land and redeveloped/infill developed land.

Transportation and Land Development Conclusions

The evolution of the region’s growth over time illustrates several key relationships between transportation and land development:

- Until the 1940s, the region grew in a compact, traditional neighborhood urban form.
- The introduction of the automobile and freeways greatly increased mobility and access to affordable, developable land.
- The rapid expansion of the region’s developed area in an auto-centric manner has resulted in longer average trips and the diminished attractiveness of non-auto modes as modes of regional travel.

- Congestion and a desire for convenient access to jobs, activities, and amenities are beginning to challenge the auto-centric development model and the region is growing in a more balanced way.

Anticipated growth will bring an estimated 880,000 additional residents and 419,000 additional households from 2010-2040, which present tremendous opportunities for the region. A related challenge is the necessary balance between the needs of those new residents and households and the needs of residents, households, and businesses already in this region.

Future Opportunities for Transportation and Land Development

There are opportunities for all types of communities to strengthen connections between land uses and transportation as the region changes in coming years. Communities at the developing edge can look long-term to adopt transportation plans for interconnected networks of streets and pedestrian and bicycle pathways that meet current and future needs. Developed suburban communities with street patterns characterized by cul-de-sacs and a loosely connected street network can look for opportunities to retrofit their transportation networks to increase street connectivity. Transit service and pedestrian and bicycle pathways can support infill development and redevelopment of existing properties. Urban area communities that developed with a grid system can look for ways to use Complete Streets practices to serve infill and redevelopment opportunities and take advantage of their existing connected transportation networks.

The existing regional growth pattern and funding limitations do not make it possible to expand the highway system in a sustainable way and still address such issues as congestion, climate change, equity, and livability. Within the last decade, an increase in the value of locations in proximity to job concentrations and high-quality transitways has elevated the pace of private investment in the already developed parts of the region. The evidence is clearly visible along the METRO Blue Line light rail, which has been operating since 2004, the Northstar Commuter Rail (2009), the METRO Red Line bus rapid transit (2013), and the METRO Green Line light rail (2014). Development interest and higher-intensity land uses are also showing up along future transit investments like the METRO Green Line and Blue Line extensions. On the local level, higher-intensity development and redevelopment is occurring throughout the already developed area and requires support with a multimodal network of local and collector streets, sidewalks, and bicycle paths (see Figure 3-3). New growth is occurring, and will continue to occur, in the Suburban Edge and Emerging Suburban Edge communities, where sewer-serviced land is available. As local governments accommodate densities discussed in Thrive MSP 2040, the resulting growth will continue to stress the regional highway system. Demand for additional highway capacity to relieve congestion and to serve the Suburban Edge and Emerging Suburban Edge communities is well beyond the available or realistic resources for transportation improvements. Consequently, this travel demand will require investments in arterial roads and strategic improvements to the regional highway system that address congestion and safety and provide reliable options. Planning by local governments will also need to focus on incorporating multimodal travel, including transit, walking and bicycling, into land use and design.

Figure 3-3 – Net Household Growth, 2010-2016 – Each dot =25 households added

Development can best support multimodal travel when communities plan their land use with knowledge of travel behavior and transportation infrastructure. Consistent with the land use policies identified in Thrive MSP 2040, this means:

- Supporting growth, particularly job growth, where job concentrations exist or in nodes along regional transportation corridors, either highway or transit.
- Improving local street connectivity and using design principles of Complete Streets during planning and designing.
- Planning for a complementary mix of land uses along corridors and in centers.

“Complete Streets” is an approach to road planning and design that considers and balances the needs of all transportation users.

- Locating medium-to-high density developments that include a mix of housing affordability at transit stations and along transit corridors.
- Implementing travel-demand management programs and parking policies that support pedestrian and transit-friendly environments in high-activity areas.
- Increasing overall density in nodes along corridors, in combination with the other strategies.

Another important consideration in coordinating transportation and land use is the needs of freight users. The freight system has evolved in ways similar to other aspects of regional growth, with a heavy reliance on highway and arterial road travel. These users need to be considered in implementing local land use policy.

Users of the river and rail freight system are particularly vulnerable to land use changes away from warehousing and industrial areas, especially in the already developed parts of the region. Many of these areas are evolving to serve the growing demand for housing and commercial development, but the river and freight rail systems are already in place and cannot move to other locations, even assuming alternatives were available. The issue is important because the region's economic competitiveness depends on preserving areas for freight operations that would be valuable assets in the future.

E-commerce, or the option of making consumer purchases through the Internet, is an established and growing trend that continues to impact local land use. It became a viable option soon after the Internet debuted in the mid-1990s, but has increased in recent years in overall volume and number of individuals participating. The global e-commerce market is projected to grow as much as 20% per year through 2025. With the expansion in economic globalization, consumers now have the ability to order direct from retailers anywhere in the world, which has changed supply chain dynamics considerably. Manufacturers and corporate retailers are developing warehouse distribution centers in numerous metropolitan centers in an attempt to meet the public's high and continually growing demand for overnight or expedited home deliveries. These centers require large parcels of land with efficient connections to major freeways and regional highways which tend to be more available in suburban areas. On the downside of this growth in e-commerce is the significant drop in retail activity at traditional regional and sub-regional shopping centers; evidence of this is easily seen in the frequent closings of major mall anchor stores, especially in the printed media and retail music industries. Cities will need to be innovative and flexible in planning for adaptive reuse of major stores (like the conversion of Macy's in downtown Saint Paul to the Minnesota Wild's hockey training facility) in downtown business districts and suburban shopping malls.

In addition, local governments need to plan for an adequate supply of land suitable for freight uses in the future and consider the connections, especially the "last mile" connections, that trucks sometimes need to make on local streets with potential design conflicts for freight movement. The region's airport system also creates unique challenges for local government land use planning (see Chapter 9, "Aviation Investment Direction and Plan," for more information).

Details about specific investments for the transportation system are discussed in Chapter 4, “Transportation Finance,” as well all the mode-specific investment plans.

Role of Transportation Technology in Land Use and Development

“An Illustrated History of Transportation and Land Development in the Twin Cities” (at the start of this chapter) demonstrated how past changes in technology have shaped the growth of the region and how people and goods move. Many of these changes were relatively rapid (over a couple decades) and the implications were often difficult, if not impossible, to predict. The future impact of transportation technology on land use and development is still difficult to predict. However, it is important to acknowledge the ways in which transportation technology could impact land use and development in potentially transformative ways.

The world around us is becoming more “smart,” with the advent of smart phones, smart televisions, and smart power grids as a few examples. As the world around us becomes more “smart,” government agencies are also evolving and learning to become more “smart” themselves. The idea of smart cities includes things like integrated traffic management, real-time information, and dynamic pricing models. It could also include emerging concepts like solar street design, where the road itself generates power for the community. There are two related transportation technological advances that have the potential to create major impacts for land use and development: autonomous vehicles and electric vehicles.

While the timing is uncertain, the United States will likely see an increase in the number of electric vehicles and the propagation of autonomous vehicle technology in the coming decades. This raises questions about the relationship to land use and development and the role of local governments.

- Cars currently spend 95% of their life parked and 5% of their life being used¹. What are the implications for the abundance of space in urban areas devoted to parking cars? (Particularly at destinations outside of the home.) Will parking be concentrated in large storage facilities throughout the region, requiring land to be set aside for this?
- Parking is currently a significant cost to housing construction. Will residential development need to provide space for car storage if autonomous vehicles are a shared-use model?
- Regardless of whether autonomous vehicles are shared or privately owned, there is an expectation that they might not park at the traveler’s destination. This will create an abundance of pick-up/drop-off activity at destinations throughout the region. How and where should this activity be accommodated and how will it be regulated? On private land? In public right of way?

¹ <http://www.reinventingparking.org/2013/02/cars-are-parked-95-of-time-lets-check.html>

- There are many household implications for autonomous vehicles in terms of the perceived cost of travel/congestion (What if you can work in your car now?). Will autonomous vehicles have an impact on preferences for housing locations and types?
- The details of autonomous vehicle operation are not known, but there may be fiscal considerations for cities as well. Will their revenue sources change significantly?
 - Fees from parking meters, parking tickets, and municipal ramps/lots
 - Fuel tax distribution (in the case of electric vehicles)
 - Shared-use taxes and fees (under a shared-use autonomous vehicle model)
- What happens to traditional gasoline and diesel fueling stations when all cars are electric?
- With autonomous vehicles presumably reducing crashes, will collision, auto repair, and auto parts shops continue to exist in the same prevalence?
- How will the public street right-of-way evolve? Will more space be available for greening streets with boulevards and other amenities when they are not perceived as safety hazards? Will more land become available for development along major transportation corridors?

Government agencies will need to start thinking about these questions, and likely many more questions that emerge as technology disrupts the way transportation shapes cities in the future. The Metropolitan Council has a work program item (see Chapter 14, “Work Program”) to explore how connected and autonomous vehicles will impact the region’s future, including the roles various levels of government may play. The Metropolitan Council will convene stakeholders from all levels of government and take a lead role in advancing the regional conversation on these topics.

Coordinating Thrive MSP 2040 & Transportation Policy Plan

The coordination of planning for regional growth and for the region’s transportation systems is accomplished through the Metropolitan Council’s *Thrive MSP 2040* and this Transportation Policy Plan. The household, population, and job forecasts developed by the Metropolitan Council through *Thrive MSP 2040* provide the basis for regional planning for roads and highways, transit service, and wastewater infrastructure, and also inform planning for the Regional Parks System.

The household, population and job forecasts were developed in close coordination with the future transportation system described in the Transportation Policy Plan. The Metropolitan Council will update local forecasts as new land use and transportation policies emerge, and as new demographic data become available. The forecasts and *Thrive MSP 2040* policies and land use strategies also serve as the springboard for planning by each community for its local infrastructure and land use needs. The local comprehensive plans must coordinate key elements: forecasted growth, planned land use, residential and employment densities and infrastructure plans.

Thrive MSP 2040 sets out seven overarching land use policies:

1. Orderly and efficient land use
2. Natural resources protection
3. Water sustainability
4. Housing affordability and choice
5. Access, mobility, and transportation choice
6. Economic competitiveness
7. Building in resilience

More details on these policies can be found in *Thrive MSP 2040* Land Use Policy.

Decisions about how communities grow and the infrastructure to support them affect one another. Regional transportation and sewer investments help shape growth patterns, vice versa. The types, locations, affordability, and density of housing influence peoples' mobility options and their travel patterns.

The relationship between land use and transportation affects key outcomes established by *Thrive MSP 2040*. For instance, land use and development patterns have an enormous impact on the environment, including transportation's contribution to air pollution and climate change. Similarly, land use and development patterns affect the region's ability to be good stewards of transportation funding and put resources where they are most impactful toward regional outcomes. Also important is the overall, sustainable economic development of the region that provides prosperity for all parts of the region and all people in it. This section describes the important considerations for land use planning that impact the transportation system and local comprehensive planning for transportation.

Coordinating Regional & Local Comprehensive Planning

Local units of governments are on-the-ground partners with the Metropolitan Council in realizing the *Thrive MSP 2040* vision for growth and change, the *Thrive MSP 2040* Land Use Policy, and the Transportation Policy Plan. Under the Metropolitan Land Planning Act, local communities adopt comprehensive plans that conform to the Metropolitan Council's three metropolitan system plans – for transportation (including aviation), wastewater treatment, and regional parks and open space. Comprehensive plans must also be consistent with the Metropolitan Council's policies in *Thrive MSP 2040* and its policy plans, including the Regional Parks, Water Resources, and Housing Policy Plans.

The local comprehensive plan is used by the region as a key element in local and regional partnerships to plan for growth across the seven-county region. Local plans ensure that adequate regional systems are planned and developed to serve growth in an orderly and efficient manner. There are also differing requirements for the different types of local governments. The majority of comprehensive planning responsibilities fall under the direction of cities and townships. This section focuses primarily on those responsibilities. The unique requirements set forth in state statute for counties vary by county. State

statute also applies solely to the seven-county Metropolitan Council jurisdiction and does not apply to the broader urbanized area that is covered by this plan under federal law.

Local comprehensive plans are reviewed by the Metropolitan Council for conformance with metropolitan system plans, consistency with Metropolitan Council policies, and compatibility with adjacent and affected governmental units (see statutory provisions below). Socioeconomic forecasts play an important role in the local and regional partnerships to accommodate growth and to see that adequate infrastructure is planned and developed. Table 3-1 is a summary of the conformance, consistency, and compatibility components of comprehensive plans that result from the Transportation Policy Plan.

Table 3-1: Local Comprehensive Planning: Summary of Conformance, Consistency, and Compatibility

Conformance: A local comprehensive plan will conform with the metropolitan system plans if the local plan does not have a substantial impact on or contain a substantial departure from a system plan, based on the following provisions:

- ❖ Accurately incorporates and integrates the components of the metropolitan system plans required by Minn. Stat. sec. 473.851 to 473.871:
 1. Local plan recognizes the land use and transportation opportunities and challenges related to the community's designation in the Thrive MSP 2040 Community Designations. Local plan accommodates growth forecasts at appropriate densities and numbers as articulated in adopted Thrive MSP 2040 Community Designations, and wastewater and transportation system policy plans.
 2. Local plan must identify transportation components and characteristics of the regional existing and planned multimodal system including road functional classification, transitways and transit facilities and corridors, park-and-ride facilities, regional trails and bikeways, and right-of-way preservation needs.
 3. Local plan must include airports, aviation facilities, noise and safety zones, and compatible land uses surrounding these features.
 4. Local plan must identify existing (current Average Daily Traffic) and forecasted traffic volumes, number of lanes on roadways (principal and minor arterials), allocation of Thrive MSP 2040 forecasts to transportation analysis zones (TAZs) and 2040 traffic forecasts for principal and minor arterials.
 5. Local plan must include adopted station-area planning for transitways and high-frequency transit corridors in service or in advanced planning stages, including density minimums, targets, and land use mix that addresses guidelines for minimum activity level.
 6. Local plans must include adopted access management guidelines for principal and "A" minor arterials.

- ❖ Integrates components of the local public facilities plan as described in Minn. Stat. sec. 473.859, subd. 3.
 1. Local plan must integrate development policies, compatible land uses, forecasted growth allocated to Transportation Analysis Zones (TAZs) at appropriate densities specified in Thrive MSP 2040 for community designations and allocation of 2040 forecasts to TAZs for development and operation of the transit system to maximize the efficiency and effectiveness of the regional system.

Consistency: A local comprehensive plan will be consistent with Metropolitan Council policies and statutory requirements if the local plan:

- ❖ Addresses community role strategies for community designations contained in Thrive MSP 2040.
- ❖ Includes a plan for the implementation of an interconnected system of local streets, pedestrian, and bicycle facilities that is integrated with the regional system.
 1. Includes a plan for local roadway systems to minimize short trips on the regional highway system.
 2. Identifies needed local infrastructure (streets, pedestrian and bicycle facilities) to support connections to existing transitways and high-frequency bus corridors and those under project development.
 3. Identifies bicycle and pedestrian network needs and policies, including:
 - a. Descriptions and maps of Regional Bicycle Transportation Network corridors and alignments.
 - b. Existing and planned connections to the Regional Bicycle Transportation Network and regional trails.
 - c. Planned improvements at regional bicycle barrier crossing opportunity locations.
- ❖ Considers travel modes other than the car at all levels of development (site plan, subdivision, comprehensive planning) to better connect and integrate choices throughout all stages of planning. A Complete Streets policy is recommended to balance the needs of all users in transportation decision making.
- ❖ Addresses job concentrations, nodes along corridors, and locally important centers and their connection to the regional transportation system, including use of travel demand management initiatives.
- ❖ Addresses the linkage of local land uses to local and regional transportation systems including a mix of uses and increasing housing unit and employment densities in regional job concentrations, in transitway station areas, and along high-frequency bus corridors.
- ❖ Creates and preserves a mix of housing affordability in transitway station areas.

- ❖ Addresses the needs of freight movement in and through the community (roadway, rail and waterway). Addresses accessibility to freight terminals and facilities, especially “last mile” connections to freight facilities that are often provided by local streets.
- ❖ Includes an implementation plan that describes public programs, fiscal devices, and other specific actions for sequencing and staging the implementation of the comprehensive plan, to accommodate growth and change consistent with TAZ forecast allocations, and to ensure conformance with regional system plans, described in Minn. Stat. sec. 473.859, subd. 4.
- ❖ Addresses official controls: Includes a Capital Improvements Program (sewers, parks, transportation, water supply and open space) that accommodates planned growth and change consistent with TAZ forecast allocations.
- ❖ Addresses state and regional goals for reducing greenhouse gas and air pollutant emissions.

Compatibility: A local comprehensive plan is compatible with adjacent and affected governmental units, including appropriate interconnection of regional, county and local transportation networks of streets, bicycle pathways and pedestrian facilities, based on comments or concerns, or lack thereof, from these entities. A community should adequately document that it has acknowledged the concern(s) of all adjacent and affected governmental units.

- ❖ Addresses coordination of transitway station-area and high-frequency bus corridor planning with other communities along identified corridors.
- ❖ Addresses partners in communities, counties, and the region at large to coordinate transportation, pedestrian, on-street bicycle and off-road trail connections within and between jurisdictional boundaries.

The Foundation for Land Use and Transportation

The local transportation system is an essential component of the daily movement of people and freight. The foundation of the transportation system and its most basic component is the street. Streets (or roads, highways, freeways) are provided in a variety of ways to meet different needs in the region. While the Minnesota Department of Transportation is the primary provider and maintainer of major highways (or principal arterials), local governments are the primary providers and maintainers of minor arterials and other local roads. The relationship of land use access from roads as well as the function of and connection between different road types is discussed in Chapter 5, “Highway Investment Direction and Plan” and Appendices D and F.

Roads, rivers and ports, freight railroads, transit, sidewalks, trails, on-street bikeways, and airports make up our region’s transportation framework. Every community in the region may not have each of these transportation elements, but every community does have roads, even though their purpose will vary depending on a community’s stage and form of development. Since very early times, roads have supported our travel – whether by foot, horse-drawn wagon or buggy, or – in the 20th century –

automobile and truck. In recent history and today, roads have propagated auto-oriented travel and development patterns, but they also support the transport of freight and people traveling in buses, on bicycles, by foot, and in wheelchairs or other assistive technologies. The road provides the support for all of these people and freight, along with important supplementary facilities within the road right-of-way, such as sidewalks, bike lanes and/or adjacent trails.

- For Urban Center, Urban, and Suburban communities, as defined by *Thrive MSP 2040*, local governments will continue providing an interconnected system of streets, sidewalks, and trails that considers all users, appropriately connects to the regional highway system, and is supported by the regional system of highways and transit. These community types may vary in how they approach transportation, depending on their local vision and needs. However, these community types are all focused on adapting the already built environment and not substantially creating new neighborhoods.

In these communities, changes to the regional transportation system will focus on adaptive improvements that better support the growing demand for multimodal travel while acknowledging the continued role of automobiles and trucks. These communities, especially those developed around the automobile, may or may not choose to diversify land use to reduce community dependence on cars.

- For Suburban Edge and Emerging Suburban Edge communities, local governments and developers will invest in new systems of streets, sidewalks, and trails, considering all users – people and freight – from the start. This should include a more deliberate approach of designing infrastructure to the scale of people instead of the automobile. The resulting change in development form will be driven by market desirability of these locations, local transportation investment, and land use planning.
- Rural areas will invest in highways and streets that are flexible for a variety of uses and connect them with Rural Centers and the urban and suburban areas within the Metropolitan Urbans Service Area identified in *Thrive MSP 2040* and its policy plans. In rural areas, the emphasis will be on strengthening safe connections and less on large-scale transportation capacity.

In all areas, the accommodation of freight movements by truck will continue to be an essential need for local transportation system and land use plans. Transportation is essential to the economic vitality of the region, both to people and businesses. A well-designed, high-quality local transportation system directly benefits the functionality and affordability of freight. Also important will be the identification of important freight-accessible land that is vital for the region to protect and support. This Plan identifies regional truck corridors to help communities plan for the efficient movement of freight. More detail on this is available in Chapter 8, “Freight Investment Direction.”

In the Urban and Suburban areas and Rural Centers, a diversity of land uses and densities creates various transportation needs. This diversity currently makes these areas attractive to some lifestyles. However, these lifestyles can change over time, and it is imperative that local governments and

regional transportation providers balance their long-term approach by planning for an affordable, coordinated, multimodal transportation system.

The following sections focus on how growth can be directed toward nodes along corridors, resulting in orderly and more efficient land use patterns.

Density and Diversification of Job Concentrations and Nodes along Transportation Corridors

The Metropolitan Council's *Land Use and Planning Resources Report*, completed in 2011 in collaboration with local governments, identifies and assesses the effectiveness of local and regional planning strategies and process for:

- Reducing air pollution
- Mitigating congestion
- Reducing costs for operating, maintaining, or improving infrastructure

The report emphasizes approaches that reduce or manage travel demand through land use and development strategies and access to transportation options.

Figure 3-4 – Thrive MSP 2040 Illustrative Existing Job Concentrations

Local land use decisions can have a significant impact on travel behavior, congestion, air quality, greenhouse gases, and livability over time. Activity centers and their characteristics play an important role in this relationship. Several strategies were found to have the greatest impact on travel behavior:

- Access to activity centers along transportation corridors
- Street design and connectivity of transportation networks
- Mix of land uses
- High-quality transit
- Density combined with other strategies
- Transportation management and parking

Research concludes that density alone is not as effective as density combined with other strategies, such as connections to activity centers, a high-quality local transportation network, a mix of land uses, and transit.

This plan places increased emphasis on linking regional transportation investments to providing or improving access to regional job concentrations. Details about this strategy are found in the investment directions and plans. Local land use decisions related to job concentrations, nodes along corridors, and local centers can further support the *Thrive MSP 2040*'s outcomes of stewardship, prosperity, equity, livability, and sustainability.

What follows are local government strategies that will be supported through Metropolitan Council strategies to create opportunities that make the transportation-land use connection more productive.

Intensify and diversify land uses in regional job concentrations, nodes along transportation corridors, and local centers to enhance access for residents and businesses.

Increasing densities while diversifying the mix of land uses can strengthen accessibility and the efficiency of the region's transportation system. Regional job concentrations and nodes should be target areas for greater housing densities, including a mix of housing affordability, to balance the mix of job, housing, service, and retail activity in centers. An increased mix of land uses has been shown to decrease auto trips per capita relative to single-use districts, where auto travel is often the only option for people.

It will be challenging for the region to create freestanding centers of mixed-use activity that can support a level of intensity that is comparable to diversifying existing areas where jobs and activity are already concentrated. These areas have commercial or industrial uses that may be attractive for redevelopment and are often targets for planned mixed-use land uses. But the overall mix of uses in areas where jobs are concentrated and in nodes along corridors is more important than specifically supporting new mixed-use developments. Similar strategies can also be applied to local centers, whether in rural areas or as the focus of a local comprehensive plan.

Support density and a mix of uses with a mix of transportation strategies and a mix of urban design strategies.

Research has shown that without additional strategies that address the travel experience to, from, and within centers, density and a mix of land uses will not translate to positive benefits in travel behavior, congestion, greenhouse gases, and air quality. There are a number of key implementation considerations for local governments:

- Provide for a dense network of arterials, local streets, sidewalks, and trails that support narrower streets and smaller intersections by distributing traffic more broadly, and create more opportunities to walk and bike. This approach will discourage the development of "super blocks" that discourage community cohesion and connectivity. Policies aligned with Complete Streets techniques are an important component of this strategy. This includes considering how truck freight access can be accommodated in the street network design, since narrower streets can cause mobility problems for trucks.

- Manage the demand for driving by exploring policies such as parking pricing, on-street parking management, shared parking facilities, and the elimination of parking minimums in zoning codes that may be requiring oversupply relative to what the market demands. This strategy is supported by the other two strategies oriented toward providing attractive travel choices, like transit, biking, and walking.
- Foster and implement good urban design through code regulations and design standards. Good urban design includes public infrastructure, such as the streetscape and public spaces, and private development including building form, mass and scale, building materials, and parking design and location.

These land use tactics for local government can be applied to regional job concentrations, nodes along corridors, and areas identified as local centers in comprehensive plans. More details on these strategies and additional resources for local governments are available in the Metropolitan Council's *Land Use and Planning Resources Report*.

Local Government Land Use Policies Supporting Transit

In Chapter 6, “Transit Investment Direction and Plan,” there is a description of the conditions needed to support an effective transit system. An essential part of this discussion focuses on development patterns that occur locally and are planned and regulated by local governments. The Transit Market Areas described there and in Appendix G demonstrate that the urban core is best suited for all-day, frequent bus service, but Transit Market Areas I and II represent only about 6% of the region’s land area despite generating the majority of transit trips.

The intensity of land use drives the cost-effectiveness of transit investments...the region will need a strong partnership with local governments to support transitway success.

Much of the region developed around cars and is not well-suited to be served by local bus routes. So, the challenge in serving other regional communities will be shaping land use plans to align with the potential for future transit service. This section describes the elements of land use and development patterns that facilitate better transit service and describes how local governments should plan for these elements to set the stage for a positive market response that is leveraged to do more in response to transit investment and planning.

National experience has shown that development around transit must have both strong local government support and market demand to be successful. Land use and local development support are critical factors in prioritizing transitway investments, where the level of investment is substantial and long-lasting.

Local communities can plan for an efficient land use and development pattern that supports local transit or transitways. This is possible where local governments:

- Plan for density of population and activity.
- Design for a pedestrian-friendly environment.

- Encourage a mixed-use land use pattern.
- Develop an interconnected street network that maximizes pedestrian and bicycle access and simple route design.
- Support the development of housing affordability to populations likely to use transit.
- Support travel options that encourage or compliment using transit.
- Plan for linear growth in nodes along corridors.

In a similar way that shaping land use can support transit successfully, transitways and high-frequency bus corridors can transform land use. The intensity of land use drives the cost-effectiveness of transit investments, particularly the ongoing cost to operate service. Regional transitway investments will need a strong partnership with local governments to support transitway success. Local governments will need to set the vision for land use around high-frequency bus and transitways and guide development and local infrastructure to implement this vision. This partnership between local governments and agencies planning and implementing transit will ensure that transit funding is invested prudently. Every potential stop or station across a variety of communities in the region has unique opportunities, but they have to come together through corridor planning to ensure successful corridor investments. If local governments choose not to commit to transit-supportive development patterns, the Metropolitan Council’s stewardship of regional resources may limit its funding share for such corridors in the current revenue scenario.

The vision and the commitment to this vision should be expressed in local comprehensive plans and station-area plans and supported by local government strategies and investments. Local governments will also need to consider corridors and their relationship to adjacent communities, including potential extensions of existing high-frequency bus service.

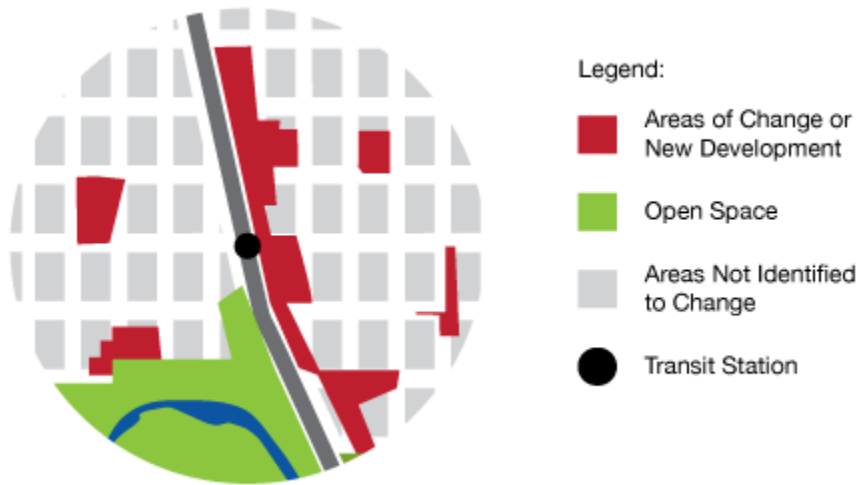

Density requirements for transit are focused on housing in expected “areas of change” identified in the local comprehensive plan, including areas identified for new development and redevelopment.

Generally, these connections will be most feasible in areas within and adjacent to Transit Market Area II, as described in “Transit Investment Direction and Plan,” although opportunities for suburb-to-suburb transit service could also be supported with strong local land use planning and implementation. An important factor for this type of service will be the focus on job concentrations.

Table 3-2 provides details on density expectations for new residential or mixed-use development around transit stations and around high-frequency transit service identified in the current revenue scenario and using the community designations in *Thrive MSP 2040*. Densities are described as the minimum average across all areas planned for new development and redevelopment within a station area or bus corridor, expressed as housing units per net acre. As described in *Thrive MSP 2040*, setting minimum average densities for new development and redevelopment provides communities with the flexibility to determine which areas are best suited for higher or lower density development under the framework of meeting that overall minimum on available developable lands. An example of a typical station-area plan is provided

in Figure 3-5, showing generalized land uses and areas of change. The table also provides an overview of other areas that local governments should be addressing through strategies that will support the density needed for transit, with more detail provided following the table. The Metropolitan Council will use various programs to support local governments in these efforts, as described later in this section.

Figure 3-5: Example Station-Area Plan

Local Government Land Use Planning Coordinated with Regional Transit Investments

Areas used to determine density requirements:

- Residential or mixed-use in areas of change or new development

Areas excluded from density requirements:

- Areas not identified to change including residential and non-residential areas
- Undevelopable land (transportation infrastructure, wetlands, public parks, steep grades, etc.)

Thrive MSP 2040 Community Designations

Residential Density Average near Transitway Stations Serving Light Rail, Commuter Rail, and Bus Rapid Transit –Density expectations represent average net densities near existing and new transit stations for areas of change that are identified for new development or redevelopment with some form of housing (housing or mixed-use).

Density for Transit Corridors Relative to Community Designation	Urban Center	Urban	Suburban	Suburban Edge or Emerging Suburban Edge
Minimum community-wide densities established in <i>Thrive MSP 2040</i>	20 units per acre	10 units per acre	5 units per acre	3-5 units per acre
Density expectations for fixed or dedicated rights-of-way transitway station area (area within 10-minute walk or ½ mile)	Minimum: 50 units per acre Target: 75-150+ units per acre	Minimum: 25 units per acre Target: 50-100+ units per acre	Minimum: 20 units per acre Target: 40-75+ units per acre	Minimum: 15 units per acre Target: 40-75+ units per acre
Density expectations for highway BRT transitway station area (area within 10-minute walk or ½ mile)	Minimum: 25 units per acre Target: 40-75+ units per acre	Minimum: 12 units per acre Target: 25-50+ units per acre	Minimum: 10 units per acre Target: 20-40+ units per acre	Minimum: 8 units per acre Target: 20-40+ units per acre
Density expectations for arterial BRT station area (area within 5-minute walk or ¼ mile)	Minimum: 15 units per acre Target: 20-60+ units per acre	Minimum: 15 units per acre Target: 20-60+ units per acre	Minimum: 15 units per acre Target: 20-60+ units per acre	Minimum: 15 units per acre Target: 20-60+ units per acre

Residential Density Average near Transit Service along High-Frequency Bus Corridors –Density expectations represent average net densities for areas of change that are identified for new development or redevelopment with some form of housing (housing or mixed-use).

Density for Transit Corridors Relative to Community Designation	Urban Center	Urban	Suburban	Suburban Edge or Emerging Suburban Edge
3-5 units per acre	Minimum: 10 units per acre Target: 15-60+ units per acre	Minimum: 10 units per acre Target: 15-60+ units per acre	Minimum: 10 units per acre Target: 15-60+ units per acre	Minimum: 10 units per acre Target: 15-60+ units per acre

Diversity of Activity at and around Transit Station Areas – The Metropolitan Council will review comprehensive plans for conformance to residential unit density, but job and activity density is equally important along a corridor. The Metropolitan Council will review station-area plans for consistency with activity level guidelines.

<p>Activity level of transitway station area (area within 10-minute walk or ½ mile)</p>	<p>Local governments should plan for a level of total “activity” near stations that is supportive of transitway investments. Activity can include residential units or residents, jobs, students, and retail and entertainment space that contribute to an overall level of activity. A guideline for minimum activity around a station would be 7,000 total residents, jobs, or students. In station areas with significant barriers or undevelopable land, this total can be adjusted proportionally (see discussion on Potential Constraints to Transit-Supportive Land Use).</p>
---	--

Other Land Use and Development Considerations near Transit and Transitway Stations – Density and activity are important, but there are other considerations in development patterns that are a part of the user experience in attracting transit riders to the system.

<p>Best practices for land use and development planning and implementation</p>	<ul style="list-style-type: none"> • Develop a walkable street network that maximizes pedestrian and bicycle access and includes facilities for all users. • Design for a pedestrian-friendly environment where streets foster an inviting experience on the way to transit. • Plan for a mixed-use development pattern at stations and in corridors that complements overall corridor development and accommodates freight movement. • Focus density in linear corridors and small areas and consider the relationship to adjacent communities and existing transit service. • Manage parking supply and provide for other options such as shared cars and bicycle facilities. • Create and preserve a mix of housing affordability. • Incorporate civic and public or semi-public spaces. • Protect and restore important natural resources in the station area. • Address barriers to private investment by using financing mechanisms for public infrastructure, site preparation, affordable housing, and other areas that require gap funding.
--	---

The implementation of local land use planning will occur through a partnership of the Metropolitan Council, regional transit providers, and local (city and county) governments. Local governments may discover, through local comprehensive planning efforts, issues or concerns that will need to be addressed. The Metropolitan Council is committed to working with local governments to plan for land use that acknowledges the challenges that a local community is experiencing while respecting the need of the region to be good stewards of public investments.

Chapter 6, “Transit Investment Direction and Plan,” includes transitway investment factors that will consider how committed local governments are to these guidelines when determining investment priorities. These considerations are also an important factor in federal New Starts and Small Starts project evaluation. Additional information can be found in the resource list.

Strategies for Local Government Land Use Planning Coordinated with Regional Transit Investments

The greatest influence on corridor development and readiness for transit service is having a long-range vision, community buy-in, and early community identification of potential supportive changes to land use patterns. Local governments should be proactive in planning for transit service so that future development and public infrastructure support transit investment. To maximize the potential of station areas, local plans should address land use, urban design, market constraints, housing affordability, the needs of pedestrians and bicyclists, and public infrastructure. These plans provide the means to coordinate land use and transportation at the community level and with other communities served by the corridor. Development potential may be influenced by the local role set through a community vision and its role in regional economy. For example, a community may have two transit stations and determine that one station is best-suited for retail and high-density residential development and the other station is best-suited for office and other commercial uses. The strategies this community chooses to implement may vary based on their local vision for each station area, but this should also be considered in the context of the corridor and region.

Encourage population and activity density. Overall community density sets the stage for cost-effective transitway and high-frequency service and potential. Market demand will be an important factor in how much allowable development is realized and when. Minimum and target densities are adjusted for market conditions, as they vary by transit type and community designation. Minimum densities for new residential development ensure that the market for transit-supportive development is not precluded by other uses. The effect of the overall development pattern in a community and along corridors or in existing activity centers and small areas is the critical factor in the transit system’s success and financial sustainability. Effective density is also closely linked to a supportive local network of streets, sidewalks and bicycle pathways and to a mix of compatible uses.

Compact, high-density development supports the region’s investment in frequent transit service and a greater variety of routes, resulting in more transportation options, less time on the road, and alleviated traffic congestion. Expanded transportation choices can also reduce the combined cost of housing and transportation, allowing households to spend their income on other consumer needs (including housing costs). At the same time, well-designed compact development contributes to vibrant, economically

healthy neighborhoods that offer a variety of goods and services, social gathering places, recreation and entertainment opportunities, and attractive character. There are areas in the region where this development pattern already exists, particularly in *Thrive MSP 2040* Community Designations of urban center and urban. These areas are also highlighted as Transit Market Areas I and II in Chapter 6, “Transit Investment Direction and Plan,” and Appendix G. Each community along a transit corridor or future transit corridor needs to create its local vision for the shared corridor.

Plan for a mixed-use development pattern. Residential density alone cannot ensure the ridership needed to sustain investments in transitways. It is important for station areas to serve a diversity of uses, scaled to meet community needs and the station’s role in corridor development. Higher development intensity generates the most ridership if it is nearest the transit station, with density further from the station tapering off near the edges of the defined transit-oriented development area.

In addition to planning for density, local governments should plan for a level of total “activity” near stations that is supportive of transitway investments. Activity can include residential units, daytime population, jobs, students, and retail and entertainment space that contribute to an overall level of activity. A guideline for minimal activity is 7,000 total residents, jobs, or students.

Plan for transit-friendly land uses. Transit journeys begin or end with walking, so pedestrian-friendly station areas are necessary for every successful transitway. It is essential that local governments adopt measures in their comprehensive plans, station-area plans, and other local controls to guide land uses that support transit ridership and prevent new or significantly expanded uses and development forms that discourage transit and walking. Table 3-3 lists examples of uses and development forms that are generally considered to either support the goal of creating an active pedestrian environment that supports transit ridership, or lead to an auto-oriented less supportive of pedestrians and transit.² The types of uses and development forms (or similar) in Table 3-3 should be considered during the development of comprehensive plans, station-area plans, and other local land use controls that implement plans, especially for new standalone uses in the area immediately surrounding the transit station (within one block of stations). The Metropolitan Council expects local governments to guide transit-supportive uses and forms and prohibit the increase in auto-oriented uses or form around transitway station areas. Uses not supportive of transit should be located elsewhere in the community. A more complete discussion of transit-supportive uses and development form can be found in the Metropolitan Council’s Transit-oriented Development Guide.

² Pedestrian & Transit Oriented Design, Reid Ewing and Keith Bartholomew, Urban Land Institute, 2013. Figure 4-1, page 56.

Table 3-1: Examples of Station-Area Land Use and Development Form Controls Supporting an Active Pedestrian Environment and an Effective Transit System

Recommendation to Support Effective Transit	Uses	Development Characteristics
Include or Incentivize in Station-Area Plans	<ul style="list-style-type: none"> • Multifamily and higher density single-family residential units that support a mix of housing affordability • Office space • Hotels • Cultural and public institutions • Health care facilities and clinics • Retail, services, and restaurants • Entertainment facilities • Post-secondary education 	<ul style="list-style-type: none"> • Maximize building frontages and entrances on the street • Varied, human-scale building design, including transparent surfaces • Landscaping, pedestrian lighting, sidewalks
Restrict or Discourage as Standalone in Station-Area Plans Transit Stations	<ul style="list-style-type: none"> • Surface parking lots (excluding park-and-ride lots)¹ • Distribution warehouses • Personal storage facilities • Outdoor storage facilities • Salvage yards • Motor vehicle sales • Motor vehicle fueling, servicing and repairs, including car washes 	<ul style="list-style-type: none"> • Off-street parking and drive aisles located between the building and the sidewalk • Drive-thru facilities • Opaque, uninterrupted surfaces along the pedestrian right-of-way

¹While surface parking lots are included in the list of discourage standalone uses, surface park-and-ride lots near stations are acceptable as an interim use and structured parking may be acceptable as a long-term use near transit station areas.

All of the listed uses in Table 3-3 involve the provision of valuable goods and services. None of them are intrinsically “bad.” However, the traditional forms of discouraged uses make it difficult to contribute to the activity levels and pedestrian environment needed to support transit investments. An area with a good pedestrian experience will possess many other design features, which are discussed later in this section.

It is essential that local governments implement these minimum land use controls and standards in areas of change around transitway station areas as soon as the transit investments are identified. In most cases, station-area plans, and official controls should be developed and adopted during transitway engineering. Alternately, an interim overlay zoning district is one way of protecting against

the introduction of new uses, or the expansion of existing uses, until station-area plans, and official controls can be adopted. Examples of transit-oriented development overlay district language, as an example for local governments, can be found in the Metropolitan Council's Transit-oriented Development Guide. To facilitate the documentation of these plans, communities should identify "Transit Oriented Development Districts" or similar districts within the land use element of their comprehensive plans to identify the areas addressed through station-area planning. Ultimately, station area plans should directly inform or be incorporated by reference into a city's comprehensive plan.

Develop an interconnected street network that maximizes pedestrian and bicycle access and allows for simple route design. Local connectivity for pedestrians and bicycles, along with streetscape design, are important factors for serving housing and job densities. Implementation of a network of Complete Streets that are friendly to all modes with streetscape and street-level design standards or guidelines should be standard practice around stations and provide the necessary local system of access. Sidewalks, trails, and bicycle facilities are an important part of this local system. Transit riders need safe and convenient walking and bicycling routes. Pedestrians will typically walk up to about one-half mile (approximately 10-minutes) to get to and from transit, although recent studies have shown that people are willing to walk longer distances to access transit with higher levels of service, such as light rail. Station area and transit corridor planning should identify opportunities to create new connections.

Design for a pedestrian and bicycle-friendly environment. Street design guidelines should be adopted that improve the user experience and enhance safety for pedestrians and bicyclists by calming traffic, narrowing crossings, providing separation between pedestrians and bicycles when needed or safety, and improving the amenities and design of areas along and abutting the street. Communities should consider approaches like Complete Streets as part of planning and implementation. Design guidelines may also need to consider unique or flexible ways to accommodate freight traffic in and through these areas.

Accommodate freight movements. Station areas also need to accommodate trucks that bring freight and goods into walkable, mixed-use areas. Transit-oriented developments can be served without creating unsafe conditions for pedestrians and bicyclists by designing in "back-door" service areas and secondary streets and alleys to separate truck movements from the main flow of pedestrian traffic, and by designing specific streets to accommodate the appropriate controls and vehicles for the anticipated levels of truck traffic.

Manage parking supply and support travel options. While inclusive of the car, transit-oriented development is about combining compact development composed of a variety of uses and access modes. Surface parking can take up considerable land. It is very expensive, however, to build structured or underground parking. To improve the land use efficiency, cities should explore ways to reduce the demand for parking or more efficiently manage its use. Cities should consider cases where they might reduce or eliminate parking minimums (e.g., senior or affordable housing), require travel demand management programs for new development, and encourage the sharing of parking by uses with different peak periods of demand.

Create and preserve a mix of housing affordability. New transit service can result in an increase in property values and rents as areas become more attractive to residents, businesses, and developers. Improvements in transit, however, should benefit those who depend on it the most. Plans for station areas and stops that include residential uses should incorporate policies for mix of housing types and affordability. As station area and corridor plans evolve from vision and development concepts to formally adopted elements of the local comprehensive plan, each stage should develop strategies to create and/or preserve a mix of housing affordability and the inclusion of affordable units in new residential projects where necessary to provide the full range of housing options. Guidance on how to develop an effective mix of housing affordability is available in the *2040 Housing Policy Plan* and will be available in the Local Planning Handbook.

Incorporate civic and public spaces. Integrate and invest in public art and civic spaces and facilities that reflect community history and culture into station areas and include community gathering spaces use. Parks and green space are also important to include.

Protect and restore important natural resources. Important natural resources around a transit station or in transit corridors are important to protect or restore, especially when increased development intensity will put pressure on natural areas. Exploring increased density on developable land can help protect important natural resources while providing valuable access to green space in dense areas.

Address barriers to leverage private market investment. Local governments should consider using financing mechanisms for public infrastructure, site preparation, affordable housing, and other areas that require gap funding to support regional and local goals for station area development. Development incentives should be targeted toward areas of change and new development.

Council Programs Supporting Transit-Oriented Development

Metropolitan Council programs and policies can assist local governments in achieving the land use policies in *Thrive MSP 2040* and the Transportation Policy Plan. The Metropolitan Council's Livable Communities grant program is available to fund community investment that revitalizes economies, creates affordable housing, and links different land uses and transportation. The voluntary, incentive-based approach of the Livable Communities program leverages partnerships and shared resources to help communities achieve their regional and local goals. The Metropolitan Council awards grants through four categories:

Tax Base Revitalization Account: Cleans up contaminated sites for redevelopment that creates jobs and/or produces affordable housing.

Livable Communities Demonstration Account: Supports development and redevelopment that links housing, jobs, and services and demonstrates efficient and cost-effective use of land and infrastructure.

Local Housing Initiatives Account: Produces and preserves affordable housing choices for low to moderate incomes.

Transit Oriented Development: Catalyzes development around light rail, commuter rail, and high frequency bus stations.

More information on these grant programs is available on the Metropolitan Council's website (metro council.org).

The Metropolitan Council also created a Transit Oriented Development Policy that provides a framework for the Metropolitan Council to play a leadership role in planning and implementing transit-oriented development throughout the region. The Metropolitan Council's Transit-Oriented Development department supports the implementation of this policy.

Potential Constraints to Transit-Supportive Land Use

There are a number of potential constraints to development potential around transit investments. These constraints will need to be discussed in collaboration with local governments to the extent that they may inhibit the feasibility of planning for land use that supports transit. Examples of these constraints include:

Market Potential – Local governments and the region are able to set the stage for development by doing land use planning, making investments in infrastructure, and providing other forms of support. However, the most important component of land development is market potential, which takes into account a number of other factors beyond planning and infrastructure. Many of these factors cannot be controlled by government, although they can be influenced and shaped. It is helpful to consider these constraints when doing planning. Market studies that are community-specific, corridor-specific, or even broader, are encouraged.

Developable Land – The potential for transformation around station areas will be limited by the amount of land that can be developed or redeveloped. This may depend on site configurations and historical uses, barriers to transit access, external factors such as major utility lines or natural resources areas, or other potential constraints that will depend on local conditions.

This list of constraints is not exhaustive, nor do all the constraints exist throughout the region. They are potential considerations for the realistic implementation of the land use policies in the Transportation Policy Plan.

Transitway Commitments and the Timing of Land Use Planning

It is important to acknowledge that many communities will require significant retrofitting in order to achieve development results that are supportive of transit. Transitways require a substantial planning process that can leave local governments with uncertainty about specific project details, such as station locations, and the timing of investments. The process of planning land use and transit investments is iterative. However uncertain transit investments are, land use planning represents a long-term outlook that also informs transit planning. The following table describes the steps local governments can do prior to a transit commitment (such as a locally preferred alternative). Once a transitway or high-frequency route is in the current revenue scenario of the Transportation Policy Plan, the expectations become more explicit, as described in Table 3-4. Communities along corridors in the increased revenue scenario can still be proactive in land use planning, similar to the actions described prior to transit commitments in the current revenue scenario.

Consistent with the Metropolitan Council’s vision, the Metropolitan Council will review planned transitways with considerations for a mix of housing affordability and access to employment in station areas. In addition, local governments along a transitway intending to apply for federal New Starts and Small Starts funding through the Federal Transit Administration should plan early to address the affordable housing components of the scoring evaluation criteria. The federal criteria assess the existing supply of legally binding affordable housing, as well as local plans and policies to preserve or increase affordable housing.

Table 3-2: Local Government Land Use Planning in Relation to Transit Commitment

Local Comprehensive Plan Element	Prior to Transit Commitment in Current Revenue Scenario	After Transit Commitment in Current Revenue Scenario
Land Use	<ul style="list-style-type: none"> • Set vision for potential/future transit corridors with goals for land use patterns that can grow into transit-supportive densities and nodes of activity. • Guide medium- and high-density housing that includes a mix of housing affordability and mixed-use development to areas along these corridors. • Consider potential transit alignments. • Work with agencies leading transit planning to identify important existing and planned transit opportunities. • Develop strategies to create and preserve a mix of housing affordability, particularly in areas where land values are likely to escalate after the transit commitment. 	<ul style="list-style-type: none"> • Adopt station area or corridor plans with an investment and regulatory framework to guide implementation. • Set density levels for new development that conform to minimums in the Transportation Policy Plan and opportunities for targeting higher densities. • Implement plans and policies to preserve and increase affordable housing within an overall mix of housing affordability. • Target property acquisition, rehabilitation, and development funding for a mix of housing affordability, including housing affordable to low- and moderate-income households, along the corridor.
Local Transportation	<ul style="list-style-type: none"> • Adopt community-wide policies for complete streets and pedestrian facilities and bicycle facilities. • Identify needed local transportation improvements to support land use vision in Comprehensive Plan. 	<ul style="list-style-type: none"> • Implement identified segments that provide an interconnected local transportation network serving the station or corridor. • Adopt transit-oriented development policies to guide development, including travel demand management.

This plan describes some general considerations for local governments, but the Metropolitan Council will provide more specific guidance through the *Transit-Oriented Development Guide*, the *Local Planning Handbook*, and other tools and resources. The following section includes some additional resources for planning around transit.

Resource List for Land Use Planning Around Transit

Transit-Oriented Development Planning Resources:

Complete Streets:

- *Urban Street Design Guide*. National Association of City Transportation Officials. <http://nacto.org/usdg/>

Bicycle and Pedestrian Planning

Bike and pedestrian infrastructure is most commonly provided by local governments and often integrated with local land use development. Local governments should consider the regional role of these local systems when doing comprehensive planning and implementing plans.

Bicycle Considerations

Bicycle infrastructure is an important consideration for both on-street and off-street options where bicycle travel is encouraged. Local governments should consider Complete Streets policies for all roads under their jurisdiction as a tool to include bicycles in the design of streets. In addition to serving local travel, local bicycle systems should provide important connections to regional systems, including:

- The Regional Bicycle Transportation Network
- Regional Parks and Trails
- High-frequency arterial transit corridors, transitway stations, transit centers, bus stops, and park-and-ride facilities

Bikeways can be made more user-friendly by providing wayfinding information along trails and on-street bikeways. Wayfinding is a system of signs designed to direct cyclists to important regional or local destinations, or to indicate distances to major road or trail intersections. When planning for local trail systems, and when implementing the Regional Bicycle Transportation Network, local agencies should consider including wayfinding systems to direct cyclists to important local destinations and regional destinations and activity clusters. Wayfinding can be especially effective where there are missing or unclear connections between cities or counties.

Local governments should also identify gaps and barriers in local bicycle networks through comprehensive planning and include possible solutions to address them. Bicycle parking and internal circulation may also need to be addressed at high-activity areas such as job concentrations, nodes, or local centers. The design, implementation, and maintenance of bicycle facilities should provide for safe, comfortable, and convenient travel options within communities. Specific regional barrier crossing opportunity locations, as identified in Chapter 7, “Bicycle and Pedestrian Investment Direction,” should be included in local bikeway network maps provided in comprehensive plans; in addition, any planned projects that may address the barriers at these critical crossing locations should be listed and/or described in local bicycle plans.

Pedestrian Considerations

Pedestrian connections are one of the most fundamental parts of a multimodal transportation system in the Urban and Suburban area as well as Rural Centers, where destinations and activity are located closer together than in the rural areas. Many people start and end their trips as pedestrians. As with bicycles, a potentially important planning consideration for pedestrians is adopting and putting into practice a Complete Streets policy. Planning for pedestrians is also integral to regional system planning. Local governments should provide and maintain pedestrian access to:

- Regional Parks and Trails

- High-frequency arterial transit corridors, transitway stations, transit centers, bus stops, and park-and-ride facilities
- Regional bicycle barrier crossing opportunity locations, where appropriate

A pedestrian-friendly environment is also a key strategy for successful dense, mixed-use areas, where pedestrian activity is often the highest.

Planning for a pedestrian friendly environment goes further than just providing access and infrastructure. The pedestrian environment is integrated with design. Good pedestrian facilities incorporate best practices that provide for a safe, comfortable, and convenient space to walk. When people are walking, they experience the streetscape in a different way than faster moving modes such as a car or bus. Local governments should consider the design and form of buildings that are adjacent to the pedestrian system, the need for street greening and shade with trees and planters, lighting and other safety elements, the proximity and speed of adjacent auto traffic, crossing facilities, signage, and other relevant elements identified through local planning.

Another element for local agencies to consider when planning for areas of high pedestrian activity is wayfinding – the system of signs used to direct pedestrians to important points of interest. Local planners should consider planning and implementing wayfinding systems where there are high levels of pedestrian traffic (for example, a local or regional trail, public plazas, historic districts) and clusters of highly visited destinations. Routing through wayfinding systems can be especially effective in directing pedestrians from a prominent trail to a commercial district, neighborhood center, or areas of entertainment or special interest.

Elements of a Good Pedestrian Experience:

Well-designed, well-maintained, safe, and secure pedestrian facilities – Sidewalks are the key building block of a local pedestrian system. They should be well-designed with appropriate widths, buffered with either parking, trees, or landscaping/grass, and maintained and kept clear of debris, snow, and ice. Also important are quality lighting, connections to land use (“eyes on the street”), traffic calming considerations including reduced turning speeds of vehicles, and traffic signals that are well-timed with considerations for pedestrians. Accessibility for all users should be integral in the design of these facilities.

Access to a mix of destinations and uses – Diverse environments attract people on foot. A successful pedestrian environment provides access to a mix of complementary uses that can include housing, neighborhood services and shopping, offices and jobs, schools, libraries, parks and civic space, and recreational facilities. This can also include connections to other modes, including bicycle facilities, transit, and well-connected parking facilities.

Manageable walking distances and crossings – A comfortable walking distance is 5 to 10 minutes or about ¼ to ½ mile (1,250 feet to 2,500 feet). The distance a person will walk varies based on the street pattern and presence of natural or man-made barriers. Wide streets and infrequent safe crossings are some of the most common barriers for pedestrians to navigate. A successful pedestrian environment addresses crossing distances by shortening them through design (for example, narrower streets, curb

extensions), providing comfortable median refuges and curbside waiting areas, and creating a visual connection across the street through pavement markings, signs, or other design elements. Safe crossings can be provided at midblock locations, where appropriate, to support direct connections for pedestrians.

A human-scale and visually interesting environment – Pedestrians experience their environment at a slower, more human-scale pace than drivers. A visually interesting and inviting pedestrian environment can increase pedestrian activity. Some key elements of a human-scale environment include landscaping, signs, and benches. However, building design and open space have the largest impact on pedestrian scaled environments. Good pedestrian design includes quality architecture and varied facades (for example, number of doors and windows, architectural elements), buildings that face the street and line the sidewalk with minimal setbacks, parking located to the back or side, connections to public art and civic and open space.

Protection from climate and environment – A successful pedestrian environment recognizes that the pedestrian is exposed to the elements. This can be softened by providing trees for shade and protection from rain and wind. Buildings can be oriented and located closer to the sidewalk and design elements can provide refuge for pedestrians. A buffer between pedestrians and auto traffic reduces the impacts of noise, pollution, and dirt.

Freight and Land Use Planning

Chapter 8, “Freight Investment Direction,” includes additional information on planning for land uses that are adjacent to freight corridors or facilities. The section also discusses the importance of planning for the long-term preservation of freight facilities through planning and considering the needs of freight as land uses change over time, particularly last-mile access to mixed-use or commercial areas.

Airport and Land Use Compatibility Planning

Most of the land surrounding the system airports now consists of built up areas or land zoned for urban uses. Lake Elmo and Airlake are the only airports that have adjacent rural land use areas. There has been a rapid transition of urban development which is enveloping land around Anoka County-Blaine and Forest Lake airports.

The Metropolitan Council has implemented land use compatibility guidelines for aircraft noise as a preventative measure to help communities control expanded development of sensitive land uses around airports. Communities use corrective land use measures to help mitigate noise in areas with existing development that is incompatible with designated noise levels. The definition and application of the guidelines are found in Appendix L, along with revised noise contours for each airport.

Additional details on land use compatibility planning with respect to airports and airspace considerations are provided in Chapter 9, “Aviation Investment Direction and Plan.”
