Temporary wastewater conveyance pipe installation is complete. Pipe testing will begin this week which involves running clean water through the temporary wastewater conveyance pipe. Once tested, wastewater from homes along the project site will be redirected to this temporary wastewater conveyance pipe. Residents should not experience any wastewater disruptions due to this process.

**Looking ahead**
Once wastewater is rerouted, work to rehabilitate the sanitary sewer under Xylon Avenue will begin. Crews will access the sanitary sewer through existing manholes. This work is expected to begin mid-June and last two to three weeks.

**What to expect**
A large, 100 foot long tent (pictured below) will be placed on Xylon Avenue between 115th and 116th Avenue N. The tent will take up the width of the street. All work will occur inside of the tent with the exception of a boiler truck running on the outside of the tent.

While we do our best to minimize impacts during construction, some temporary inconveniences such as 24-hour lighting, noise, and odors may occur as this work takes place.

Xylon Avenue will be temporarily closed to through traffic, but the street will only be blocked between 115th and 116th Avenues N. A detour route is included here. Residents who will experience driveway impacts will be contacted before work begins.
More about the process
We are using a process called Cured-in-Place-Pipe (CIPP) - installing a liner inside the existing sewer pipe and manholes (see pictures below).

CIPP is a technique that avoids large amounts of excavation by installing a liner in the existing sewer pipe through existing manholes.

Safety
Please keep your distance from any materials and equipment – only authorized personnel are permitted in our work areas. We want you and our crews to stay safe during construction.
