Sewer pipe inspection is completed

Crews have completed inspecting 15,000 feet of regional sanitary sewer pipes between Chaska and Shakopee using SmartBall Technology (see project map below). Metropolitan Council Environmental Services staff will analyze the data collected from the acoustic sensors in the SmartBalls, to determine the condition of the pipes and make recommendations for any future rehabilitation needs.

Although crews have begun site clean-up and restoration activities, most of the restoration work will occur after the ground thaws. All activities are anticipated to be completed May 2019.
