MCES Shakopee Odor Project

Fan Test Description:

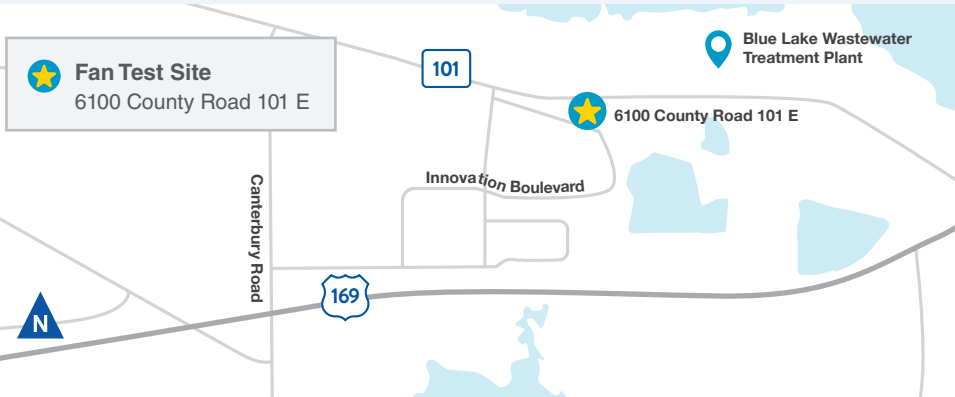

MCES will conduct a fan test at 6100 County Road 101 East. A fan will be placed over an MCES sewer maintenance hole at that location to determine how much odorous air can be extracted at that location and treated.

PROJECT SCHEDULE:

In winter 2021-2022, MCES is planning for two days of intermittent fan tests. The fan tests will be used to determine the length of sewer that can be impacted by air extraction and treatment from this location. Test dates will be updated on the project website as they are confirmed.

WHAT TO EXPECT:

While we do our best to minimize impacts during testing, some temporary inconveniences may occur as work takes place, including noise and smell. Odor and noise levels will be temporary and within safe levels for health.

PROJECT LOCATION:

The study will take place within the City of Shakopee at an MCES sanitary sewer maintenance hole.

PROJECT DESCRIPTION

Metropolitan Council Environmental Services (MCES), operator of the metro-area wastewater collection and treatment system, is studying methods to reduce odor and corrosion associated with MCES sanitary sewer pipes that serve homes and businesses in the City of Shakopee, Minnesota.

MCES collects the City of Shakopee wastewater and conveys it to the MCES Blue Lake Wastewater Treatment Plant, where it cleans and discharges the treated water to the Minnesota River. Wastewater that leaves homes and businesses in the City of Shakopee ages as it travels through city and MCES sanitary sewers to the treatment plant. Biological and chemical reactions occur in "old" wastewater which can create odors. MCES is looking to improve the management of odor and corrosion in the MCES sanitary sewers that serve the Shakopee area.
